

Equilibrium ball float valve with balanced single seat - Mod. ATHENA

The ATHENA is a single seat upstream pressure balanced equilibrium ball float valve, which automatically controls the constant level of a tank or reservoir, regardless of upstream pressure variations, and shuts off when the maximum level is reached. Thanks to its exclusive technology ATHENA brings the concept of reliability and performance to the highest standards.

Technical features and benefits

- Body in ductile cast iron with three ways, allowing the installation both with an angle or a globe pattern, containing an interchangeable sealing seat and piston in stainless steel and a guiding bush in bronze.
- Mobile block composed of the main shaft, obturator, gasket retainer and piston featuring a unique self-cleaning technology (pat. pending) to reduce the accumulation of dirt and maintenance operations.
- The lever mechanism, in zinc-plated or stainless steel, is obtained from a double rod (single rod for DN 40/50/65) which, by means of pivots, puts the shaft in communication with the float which imparts the movement allowing the opening or closing of the valve.
- A large float in stainless steel AISI 304/316 is connected to the lever mechanism by means of a stainless steel pipe, onto which it exerts a vertical force.
- The valves modulates and throttle the inflow proportionally to the consumption, accuracy and perfect water-tightness is guaranteed also with low pressure values.
- Thanks to the upstream pressure balanced seat the movement of the obturator and valve performance is not affected by upstream pressure fluctuations, transient and unwanted surges are therefore avoided.

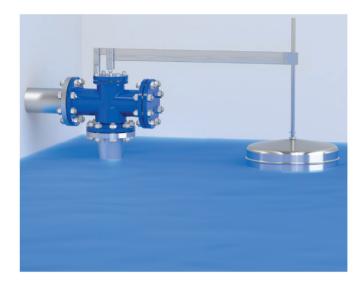

Applications

- Water distribution systems.
- Fire protection storage tanks.
- Irrigation systems.
- Whenever the constant level regulation and control function is required.

Operating principle - Angle pattern installation

Athena ball float valve is the best solution for a constant maximum level control balancing the inflow and outflow demand. Driven by a large float in stainless steel the valve closes drip-tight at the maximum level, and modulates to maintain it as soon as it drops due to consumptions.

Closed valve

When water level reaches the maximum operating point levers are perfectly horizontally aligned and the valve closes thanks to the upward force exerted by the float.

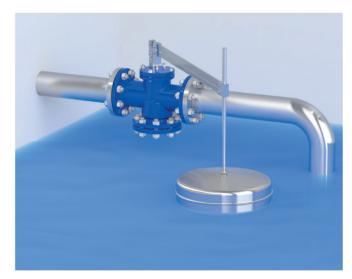

Opened valve

As the reservoir level drops the valve opens proportionally through the levers, receiving a downward force from the float, to increase the filling rate.

Globe pattern installation

The three ways body of Athena allows both the installations an angle and globe pattern, simply by placing the blank flange to the desired outlet. The lever mechanism is normally aligned with the valve axis. It is possible to rotate it on site, with an angle of 45°/90°, to fit the installation requirements.

Optional

• Anti freezing device. On request the valve is provided with a 3/8"G threaded outlet, which can be used as an anti-freezing device, simply by replacing the tap with a drainage ball valve discharging directly into the tank.

During the winter season, when the temperature drops consistently, the partial opening of the drainage port will create a flow circulation avoiding frost and possible damages related to it.

Technical data

Installation

- Make sure that the supply pipe has the flanges drilled according to the requested PN and that ATHENA is installed horizontally, properly fixed and sustained.
- Gate valves and filters have to be installed to allow for maintenance operations, and to prevent dirt from reaching the internal components of the valve.
- Position the valve in a place which is easy to reach and wide enough for maintenance and control purposes.
- Observe the overflow level and make sure that the outlet flange remains always above it, this is to avoid back-flow.
- In case of excessive Δp, to avoid cavitation and possible damages to the valve, a direct acting pressure reducing valve CSA VRCD series should be installed.

Working conditions

Fluid: treated water.

Maximum temperature: 70°C.

Maximum pressure: 16 bar; contact CSA for higher values.

Standard

Certified and tested in compliance with EN-1074/5.

Flanges according to EN 1092/2.

Epoxy painting applied through fluidized bed technology blue RAL 5005. Variations on flanges and painting on request.

DN mm	40	50	65	80	100	125	150	200	250	300
Kv (m³/h)/bar	21,6	21,6	46,8	68,4	108	155	245	360	648	1008

DN mm	40	50	65	80	100	125	150	200	250	300
Kv (m³/h)/bar	18,4	18,4	39,6	59,4	90	133	209	313	576	864

Head loss coefficient for angle pattern

Kv coefficient representing the flow rate flowing through the valve fully open, and producing a head loss of 1 bar.

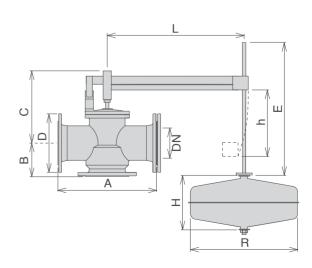

Head loss coefficient for globe pattern

Kv coefficient representing the flow rate flowing through the valve fully open, and producing a head loss of 1 bar.
